The superantigen is derived from staphylococcal superantigen sets.

SEES by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst maintaining production levels and biological activity: R20G, N21T, S24G, R27K, K79E, K81E, K83S and D227S. SEA/E-120 has been genetically fused to the Fab moiety of the tumour reactive antibody 574 to form a claimed conjugate (see ABP58454) designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  in T-cell

'n Walse Forsberg G, Erlandsson E, Antonsson P,

WPI; 2003-201467/19.

Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface structure,

Claim 12; Fig 10; 102pp; English.

The present sequence is a conjugate of a bacterial superantigen and an antibody moiety, and has been designed to target and destroy cancer cells. The bacterial superantigen is SEA/E-120 (see also ABPS8455), which was derived from staphylococcal enterotoxin E (SEE) by the incorporation of the following amino acid substitutions to reduce seroreactivity whilst maintaining production levels and biological activity: R20G, N31T, S24G, R27K, K79E, K81E, K83S and D227S. SEA/E-120 was genetically fused to the Fah moiety of the tumour reactive antibody 574. Substitutions were made in the 574 sequence to obtain higher yields: in the heavy chain, H41P, S44G, IS9T and V113G; and in the light chain, F10S, T45K, I63S, F73L, T77S, L78V and L83A. An expression vector comprising DNA encoding the conjugate can be used to transform host cells for recombinant production of the conjugate. The conjugate is useful for treating cancer, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach,

(ACTI-) ACTIVE BIOTECH AB

Walse Forsberg G, Erlandsson E, Antonsson P,

WPI; 2003-201467/19.

Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface structure.

Example 3; Fig 3; 102pp; English.

The present sequence is the protein sequence of engineered staphylococcal superantigen SEA/E-18. The superantigen is based on staphylococcal enterotoxin E (SEE, see ABPS8456) except for 4 amino acid residues close to the N-terminal that were from enterotoxin A and one substitution in the C-terminal part, D227A. Models of new superantigen variants were constructed using the SEA/E-18 model as the template. These include the new engineered superantigen SEA/E-120 (see ABPS8455), which has been genetically fused to the Fab moiety of the tumour reactive antibody 574 to form a conjugate (see ABPS8454) polypeptide. The conjugate is a claimed example of novel conjugates of the invention comprising an engineered bacterial superantigen and an antibody moiety. The conjugates are designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed

                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This is a modified Staphylococcus enterotoxin SEE superantigen. The wild-
type SEE superantigen is modified to be used in a novel conjugate. The
novel conjugate comprises a target seeking moiety and a modified wild
type superantigen. This modified superantigen retains its ability to
activate a subset of T cells, even though 1 or more wild-type amino acid
residues in at least 1 region which functions in determining binding to T
cell receptor (TCR) and activation of a subset of T cells has/have been
replaced. Such a modified superantigen can optionally be used as part of a
conjugate with a target seeking modety, for activating the immune
system to treat a mammalian disease. A pharmaccutical composition can be
prepared comprising a modified antibody (preferably a Fab fragment fused
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.

H,
                      manner) in which cysteines providing for interchain cysteine linkages in the native antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild-type superantigen is used for treating cancer, viral infections, parasitic infestations and autoimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer side effects when used as a drug, compared to wild type superantigen. Note: This sequence is not provided in the specification. It has been created by modifying the wild-type SEE superantigen sequence in Pages 38-9 of the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      120

                                                                                                                                                                                                         9
                  The present sequence is the protein sequence of staphylococcal enterotoxin SEE. The invention provides novel conjugates (see ABP58454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABP58455), which is based on SEE, and an antibody moiety, such as tumour reactive antibody 574. The superantigen is engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The conjugates are designed target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a compound that inhibits the formation of or disrupts a DP107/DP178 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP178 complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise

DP178-like and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein g941 from human immunodeficiency virus I (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of g941 from HIV-LIAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex. Doth in the presence or absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents a peptide sequence from Staphylococcus aureus enterotoxin type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        à
                                               The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive concentration of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTIS, 107x19x4 or PLZIP sequence search motifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group or macromolecular carrier group, and Z comprises a carboxyl group, amido group, hydrophobic group, or macromolecular carrier group, and C comprises a carboxyl group, amido group, hydrophobic group, or macromolecular carrier group, and cusion of the virus to the cell is inhibited. The peptides were identified by analysing the structure/motifs present in the HIV-C glycoprotein 41 anti-HIV peptides DP107 and DP178. These heptad repeat containing peptides were used to design the motifs cited above, which in turn were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic corganisms and HIV isolates, looking for DP107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to protein from a pathogenic organism analysed for regions analogous to protein from a pathogenic organism analysed for regions analogous to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ô

The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantisen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an

This is the wild-type Staphylococcus enterotoxin SEE superantigen. This SEE superantigen can be modified to be used in a novel conjugate. The novel conjugate comprises a target seeking molety and a modified wild cativate as subset of T cells, even though 1 or more wild-type amino acid residues in at least 1 region which functions in determining binding to T residues in at least 1 region which functions in determining binding to T residues in at least 1 region which functions in determining binding to T residues in at least 1 region which functions in determining binding to T residues in at least 1 region which functions in determining binding to T residues in at least 1 region which functions in determining binding to T residues in a target seeking moiety, for activating the immune a conjugate with a target seeking moiety, for activating the immune prepared comprising a modified antibody, for activating the immune prepared comprising a modified antibody for interchain cysteine linkages in the network of the native antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild type superantigen is used for treating cancer, viral infections, parasitic infestations and cutchimune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer immunogenicity and reactivity with heutralising antibodies and has fewer side-effects when used as a drug, compared to wild type superantigen
                                                                                                                                                                                                                                                                                                                               Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.

A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English.

The invention relates to a mammalian cell receptor, useful in the creatment of cancer, which binded so tunour associated lipids and induces anergy or apoptosis in the T cells and antigan presenting cells (APCS). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces callular inactivation or death is deleted or functionally deactivated to producing (MJ) a tumouricidal lipids to contact immunocytes in which creeptors for immunosuppressive fatty acids, ceramides, Altocipids, sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosides, sphingolipids, glycosphingolipids, phosphosphingolipids, gangliosides, sphingolipids, procedivedolipids are fractivated or deleted), a construct useful in the treatment of cancer comprising a custom construct useful in the treatment of cancer (comprising a lipid reaff conjugated to a superantigen), producing (MJ) a uncortivated), a composition was sociated antigens is deleted or inhibits rel activation by tumour associated antigens is deleted or cancer (comprising a lipid raft conjugated to a superantigen), producing (MJ) at monuricidal immunocyte population, and administering the tumouricidal immunocyte population, and administering the tumouricidal lipids are inactivated or deleted to produce a tumouricidal lipids are inactivated or deleted to produce a tumouricidal lipids are inactivated or deleted to produce a tumouricidal lipids are inactivated or deleted to produce a tumouricidal lipids are inactivated or deleted or functionally descrivated by producing (M) a tumouricidal lipids and mammal by allowing a tumouricidal lipids are inactivated antigened antigened or produce a tumouricidal population of religions and administering the tumouricidally activated or produce a lumouricidally activated or produce a lumouricidally activated or produce a lumouricidally activated or produce a lumouricidally activated or produce a lumouricidally activated or including a superantigen-lipid raft to contac

tumours. Bacterial superantigens are co-administered or administered as flusion constructs with anti-tumour proteins or motifs. The present sequence represents a bacterial superantigen protein (e.g. a staphylococcal enterotoxin). Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from the US patnet office website at "seqdata.uspto.gov/sequence.html?DocID=20020177551"

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               183
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      180
      treating cancer
                                                                                                                                        The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SEs) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity dentical to that observed for the protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enterotoxin E; SEE; superantigen; antigen; tumour; cancer; antitumour;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ò
                                                                                                                                                                                                                                                         staphylococous aureus: Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB76234-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are enterotoxin A and enterotoxin B, and to streptococcal pyrogenic exotoxins, with statistically significant sequence homology and similarity (2 value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similar hydropathy profiles. These superantigens are used to treat solid tumours, including their metasteses, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEE. Synthetic polypeptides having structural homology to staphylococcal exctoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 HPWYNDLLVDLGSTAATSEYEGSSVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 120
                                                                                                                                                             The present sequence is the protein sequence of staphylococcal entertoxin A (SEA). The invention provides novel conjugates (see ABP58454) for human cancer therapy. These comprises an engineered bacterial superantigen, such as novel SEA/E-120 (see ABP58455), and an antibody moiety, such as tumour reactive antibody 5T4. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DP178-like; DP107-like; enterotoxin A; antifusogenic;

                                                                                                                                                                                                                                                                    cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The entertoxin can be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SEA. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. Identifying a compound that inhibits the formation of or disrupts a DP10/7/DP198 complex, especially compounds with antifusogenic, antiviral or intracellular modulatory activity, by detecting the formation of a DP107/DP198 complex.

Disclosure, Fig 42; 259pp; English.

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise DelTale and DP107-like peptides. The DP178 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-LIAI. The invention also relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex. The method comprises detecting the formation of a DP107/DP178 complex, both in the presence or besence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence represents a peptide sequence from Staphylococcus aureus enterotoxin A

of Epstein-Barr virus to a cell, by contacting consisting of a region of Epstein-Barr virus. Inhibiting transmission the cell with a peptide

Example; Fig 42; 716pp; English.

The invention relates to inhibiting (M) transmission of an Epstein-Barr virus to a cell, comprising contacting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive amino acids of an Epstein-Barr virus protein for an effective period of time, where the region is recognised by one or more of ALLMOTIS, 10741844 or PLZIP sequence search morifs, the peptide further comprises an amino terminal X, and a carboxy terminal Z in which X comprises an amino group, actyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, and comprises a carboxyl group, amido group, hydrophobic group, and comprises a carboxyl group, amido group, hydrophobic group, and comprises a carboxyl group, amido group, hydrophobic group, and comprises a carboxyl group, amido group, hydrophobic group, and comprises a carboxyl group, amido group, hydrophobic group, and poptides were claim to the virus to the cell is inhibited. The peptides were is dentified by mallyshing the structure/motifs present in the HIV-1 glycoprotein 41 anti-HIV beptides bP107 and DP178. These heptad repeat motif containing peptides were used to design the motifs cited above, which in turn were used to analyse from other pathogenic organisms and HIV isolates, looking for DP107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to a carboxy analysed for regions analogous to DP107 or DP178 r C hydrophobic

```
A cDNA clone (AAT45699) codes for staphylococcal enterotoxin A (AAW06738) superantigen. Nucleic acids encoding superantigens (see also AAW06737, AAW06739), esp. truncated forms of the superantigen lacking the leader peptide, can be used in the gene therapy of cancer, infectious diseases and immunological disorders. The nucleic acid, optionally in combination with cytokine or chemokine nucleic acids, is delivered to an animal using e.g. liposomes. It acts by controlling the activity of effector cells, such as T-cells, macrophages, monocytes and/or natural killer cells. Localised prodn. Of an effective but non-toxic amount of encoded proteins allows safe treatment of the animal
                                                                                                                                                                                                                                                                                                                   Recombinant molecule encoding super:antigen and opt. cytokine or chemokine - controls activity of effector cells (T cells, monocytes, natural killer cells), used for gene therapy of cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ô
                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to novel oligonucleotide primers directed against enterotoxin A gene (ent. A) of Staphylococcus aureus and heat stable enterotoxin Agene (pst) of bacteria for simultaneously detecting food oligonucleotide primers are useful for simultaneously detecting food oligonucleotide primers are useful for simultaneously detecting food poisoning bacterial species Staphylococcus aureus and/or Yersinia without prior enrichment for preventing food poisoning outbreak. The PCR without prior enrichment for preventing food poisoning outbreak. The PCR as low as one cell. The method can be directly used for detecting bacterial strains. The oligonucleotide primers allow quick and highly sensitive detection of the food poisoning bacterial species. This sequence represents the protein derived from the enterotoxin A gene from Staphylococcus aureus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enterotoxin A; superantigen; antigen; cytokine; chemokine; T cell; lymphocyte; monocyte; natural killer cell; gene therapy; cancer; vaccine; adjuvant.

                                                                                                                                                                                                                                                                                                       The sequences given in AAR45011-21 are Staphylococcal enterotoxins (SES) which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit temouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. (Updated on 25-MAR-2003 to correct PN field.)

This is the wild-type Staphylococcus enterotoxin SEA superantigen. This SEA superantigen can be modified to be used in a novel conjugate. The novel conjugate compisies a target seeking moiety and a modified wild type superantigen. The modified superantigen retains its ability to activate a subset of T cells, even though I or more wild-type amino acid residues in at least I region which functions in determining binding to T cells receptor (TCR) and activation of a subset of T cells has/have been replaced. Such a modified superantigen can optionally be used as part of a conjugate with a target seeking moiety, for activating the immune of a conjugate with a target seeking moiety, for activating the immune prepared comprising a modified antibody (preferably a Fab fragment fused to a peptide moiety providing activation of T cells in Vbeta specific manner) in which cysteines providing for interfain cysteine linkages in the native antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild-type superantigen is used for treating cancer, viral infections, parasitic infestations and for treating cancer, viral infections, parasitic infestations and immunogenicity and reactivity with neutralising antibodies and has fewer immunogenicity and reactivity with neutralising antibodies and has fewer immunogenicity and reactivity with neutralising antibodies and has fewer side-effects when used as a drug, compared to wild type superantigen
                                                                                                                                                                                                                                           Conjugate of target seeking moiety and modified superantigen - useful for activating the immune system to treat cancer, viral infections, parasitic infestations and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in in vivo contains and expresses an exogencus nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Superantigen; Shg; staphylococcal enterotoxin; tumour; cancer; apoptosis; gene therapy; mammalian cell receptor; tumour associated lipid; anergy; T cell; antigen presenting cell; tumouricidal immunocyte; cytostatic; APC; antitumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumor cell capable of stimulating antitumor immune reactivity in vitro or

```
ceptors for immunocytes oppulation in vivo in a mammal correctory for immunocytes in which receptors for immunocytes fatty acids, ceramides, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, glycolipids, captorolipids, glycolipids, captorolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycolipids, glycoli
                                                                                                                                                                                                                                                                                                                                                                                    A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induce anergy or apoptosis in the T cells and antigen presenting cells (APCs). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (MI) a tumouricidal immunocyte population in vivo in a mammal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Disclosure; Page; 167pp; English

exctoxins and staphylococcal exfoliative toxins (see ABB76234-44). In the present invention, synthetic polypeptides useful in tumour therapy and in blocking or destroying autoreactive T and B lymphocyte populations are characterised by substantial structural homology to staphylococcal exercising a substantial structural homology to staphylococcal carterotoxin A and enterotoxin B, and to streptococcal pyrogenic exercising (Z value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and tumours, including their metastases, without radiation, surgery or standard chemotherapeutic agents. A claimed method of human cancer treatment involves contacting haematopoietic cells from a patient with a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               180

The present sequence is the protein sequence of staphylococcal enterotoxin A (SEA) vaccine, periplasmic (A489270P). The vaccine comprises 3 amino acid substitutions introduced into the SEA sequence: L48R, Y89A and D70R. These mutations reduce the binding of the toxin to major histocompatibility complex (MHC) Class II and/or T cell receptors. The full-length expressed product is secreted into the periplasmic space of Escherichia coli host cells, and the leader peptide is recognised and cleaved by a native mechanism. The vaccine is used to protect against the superantigen toxin infections. Superantigen attributes are absent, but the superantigen toxin infections Superantigen attributes are absent, but the superantigen toxin infections produced. In examples from the appropriate antibody response is produced. In examples from the against challenge with wild-type toxin. Methods of protect animals against challenge with wild-type toxin. Methods of producing and using the altered superantigen toxins as vaccines, and in diagnosis and superantigen toxins from SEA, SEB, SEC-1, TSST-1 and streptococcal SPEA is predicted to provide protective immunity against the majority of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or I cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or I cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin
                                                                                                                                                                                                                                                             New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   25 SEKSEEINEKDLRKKSELQGTALGNLKQIYYYNEKAKTENKESHDQFRQHTLFKGFFTD

The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered SYST-1 (toxic shock syndrome toxin) superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin) superantigen toxin peptide, diagnosing superantigen essociated bacterial infection, an infection, an autisent superantigen associated bacterial infection, an antisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1. Also disclosed are mutated staphylococal enterotoxin a and b (SPBA and SPBA). The superantigen toxin DNA fragment is useful for preparing a composition for treating or prevential infection. The present sequence represents the L42E/L48B/D70R/Y92A (with reference to the mature protein sequence) mutant of periplasmic SEA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                superantigen toxin DNA fragment, useful for preparing a composition treating or preventing bacterial infection.
                                                                                                                                                                                                                                                                                        /note= "Wild-type Tyr substitued by Ala"

DNA fragments of the invention are useful in the production of vaccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the superantigen toxin DNA fragment, useful for preparing a composition treating or preventing bacterial infection. 'note= "Glu encoded by AGAA" /note= "Ser encoded by C"

The present sequence is represents a mutant Staphylococcal enterotoxin A.

It is encoded by a mutant SEA gene. The mutant gene product is unable to bind to the MHC on T -cells, and so is non-roxic. Mutant SEA and SEB genes were inserted into a Veneautalan equine encephalitis (VEB) replicant vector, to produce vactine vectors. The mutant gene product is unable to bind to the MHC on T -cells, and so is non-toxic. Self-replicating RNA derived from the recombinant WE vectors can be used as a nucleic acid vaccine, or to transfect cells along with RNA from helper plasmids. The recombinant proteins produced are used as vaccines for providing immunity against Staphylococcal intoxication or as a diagnostic tool for detection of Staphylococcus exotoxin. The transformed host cells are used to analyse the effectiveness of drugs and agents which inhibit S. aureus exotoxins or release of exotoxins. Infectious alpha-virus particles comprising the mutant SEA or SEB genes are used for providing immunity against Staphylococcal exotoxins by generating a protective immune reaction in humans or animals. The vaccines are used to reduce disease castion in humans or animals. The vaccines are used to reduce disease surface. New DNA construct useful as vaccines against enterotoxins of Staphylococcus aureus which causes gastrointestinal distress, or toxic (USME-) US MEDICAL RES INST INFECTIOUS DISEASES. wild-type toxin. Methods of producing and using the altered superantigen toxins as vaccines, and in diagnosis and therapy, are provided. A multivalent vaccine consisting of altered superantigen toxins from SEA, SEB, SEC-1, TSST-1 and streptococcal SFEa is predicted to provide protective immunity against the majority of bacterial superantigen toxins

and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or I cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating reperantigen-associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the superantigens to drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of staphylococcal enterotoxin
                                                                                                                                                                                                                                                                                                                                                                                  121

The invention provides a superantigen toxin DNA fragment which has been genetically altered such that binding of the encoded altered toxin to either the WHC class II or T cell antigen receptor is disrupted or altered. DNA fragments of the invention are useful in the production of vaccines against bacterial superantigen toxin infections. They are also useful in gene therapy. The present sequence is a protein related to the
                                                                                                                                                                                                                                                                                                                                                                                                                                  New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2 EKSEEINEKDLRKKSELQGTALGNLKQIYYYNEKAKTENKESHDQFRQHTLFKGFFTDH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             . <del>Q</del>
                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MRC class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment) a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered SSTS-1 (toxic shock syndrome toxin) superantigen toxin, peptide, diagnosing superantigen-associated bacterial infection, an autisent (comprising an altered superantigen toxin for producing antigened communogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an antisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1. Also disclosed are mutated staphylococcal enterctoxin a math and streptococcal pyrogenic enterctoxin a and b (SPEa and SPEb). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the L42E/L48R/D70R/Y89G/Y92A mutant of cytoplasmic SEA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       62 PWYNDLLVDLGSTAATSEYEGSSVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTE 121

superantigen toxin; vaccine; mutein.

Staphylococcus sp.

Synthetic

```
The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MEC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA superantigen-associated bacterial infection. The DNA fragments are performed by acciding vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the staphylococcus enterotoxin A Kids matent. Note: The present sequence is not present in staphylococcus enterotoxin A sequence (see ACA61178)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                  New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121

New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial

infection

```
The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen associated battered. The superantigen toxins, DNA superantigen associated batterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the staphylococcus enterotoxin A Y64A mutant. Note: The present sequence is not present in the specification but was created by the indexer from the wild-type staphylococcus enterotoxin A sequence (see ACA61178)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         121
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         181

Enterotoxin A; superantigen-associated bacterial infection; mutant;

Staphylococcus enterotoxin A Y64A substitution mutant.

```
The present amino acid sequence is the mutant Staphylococcal enterotoxin of SEA, a bacterial superantigen toxin (SAg), used for the formulation of SEA vaccine A489270P. The coding region of this SAg toxin is altered by site directed mutagenesis, that results in disruption of binding of the toxin to both the MRTC class II or T-cell anigen receptor. This altered SAg toxin has the leader peptide cleaved by native bacterial enzymatic mechanism and the first residue of the mature protein is encoded by the transcriptional start site (ARG). SEA has antibacterial and cytostatic activity. This sequence is useful for the production of SEA vaccines and specific antibodies. This vaccine overcomes the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present amino acid sequence is the Staphylococcal enterotoxin A (SEA), a bacterial superantigen toxin (SAA). The coding region of the SAG toxin when altered by site directed mutagenesis, results in disruption of binding of the toxin to both the MHC class II or T-cell antigen receptor. SEA has antibacterial and cytostatic activity. This sequence is useful for the production of SEA vaccines and specific antibodies. This vaccine overcomes the disadvantages of the chemically inactivated toxoids and is staphylococcal and streptococcal toxins. It is used for the diagnosis and treatment or amelioration of superantigen- associated bacterial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          144
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 121 EEKKVPINLMIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180

Terman DS;

WPI; 2003-361759/34. N-PSDB; ACA64697. A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis in T cells and antigen presenting cells.

Disclosure; Page; 167pp; English.

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tumour associated lipids and induces anergy or apoptosis in the T cells and antigen presenting cells (APCs). Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tumour associated lipids and induces cellular inactivation or death is deleted or functionally deactivated, producing (M1) a tumouricidal immunocyte population in vivo in a mammal 

cc (by allowing tumour associated lipids to contact immunocytes in which receptors for immunosuppressive fatty acids, ceramides, glycolipids, spinolipids, glycosphingolipids, phosphosphingolipids, gangliosides, spinoglipids, glycosphingolipids, phosphosphingolipids, gangliosides, spinioglipids, glycosphingolipids and protecegly obligids are inactivated or clatedd, a construct useful in the treatment of cancer comprising a useful in the treatment of cancer (where an adaptor protein which inhibits T cell activated), a composition useful in the treatment of cancer (comprising a lipid raft conjugated to a superantigen), producing inhibits T cell activated), a composition useful in the treatment of cancer (comprising a lipid raft conjugated to a superantigen), producing cancer (comprising a lipid raft conjugated to a superantigen), producing (M2) a tumouricidal immunocyte population, and administering the tumouricidal and inwunocytes to the host), producing (M3) a tumouricidal immunocyte population, and administering the tumouricidal lipids are inactivated or deleted to produce a tumouricidal inwunocytes to the host), producing (M3) a tumouricidal immunocyte to the host), producing (M3) a tumouricidal lipids are inactivated or deleted to produce a tumouricidal population of vivo in a mammal by allowing a tumouricidal population as vivo in a mammal by allowing a tumouricidal population of contact APCs, in which adaptor proceins, which inhabit T cells and administering the tumouricidal population of T cells, and deactivated to produce a tumouricidal population of T cells and animoment of administering the tumouricidally activated T cells to the host), producing (M3) a cumouricidal T cell population in vivo in a mammal low and animoment associated anityen of the contact immunocytes in which adaptor tumour associated anityer or mammal low administering the tumouricidally activated) and producing (M3) a tumouricidal T cell population in vivo in a mammal compressive tumouricidal T cell population in vivo in a mammal contr

```
The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                                                                                                                                                                                                      Tumor cell capable of stimulating antitumor immune reactivity in vitro or in vivo comprises exogenous nucleic acids encoding a superantigen and a costimulatory molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         127 INLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQRGLIVF 186

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                which may be used in the methods of the invention for treating cancer in a patient. These SEs, and homologues of them, can be used as tumouricidal agents for treating cancers and autoimmune disease. They exhibit tumouricidal activity and toxicity identical to that observed for the Protein A perfusion system. They may be administered by i.v. injection. Staphylococcal enterotoxin
                                                                                                    Staphylococcus aureus
               15-OCT-1991
                                                                                                                               WO9110680-A
 The present sequence is the protein sequence of enterotoxin D (SED) of Staphylococcus aurens. Similarity is shown, in several stretches of sequence, between staphylococcal enterotoxins, streptococcal pyrogenic exotoxins and staphylococcal exfoliative toxins (see ABB76234-44). In the present invention, synthetic polypeptides useful in tumour therapy and in conservation, synthetic polypeptides useful in tumour therapy and in characterised by substantial structural homology to staphylococcal characterised by substantial structural homology to staphylococcal enterotoxin A and enterotoxin B, and to streptococcal pyrogenic contextoxins, with statistically significant sequence homology and similarity (2 value of Lipman and Pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and similarity (2 value of Lipman and pearson algorithm in Monte Carlo analysis exceeding 6) to include alignment of cysteine residues and tumours, including their metaesuperantigens are used to treat solid tumours, including their metaesupes, without radiation, surgery or treatment involves contacting homentopoletic cells from a patient with one or more superantigens are vivo to generate stimulated cells, selecting a specific V beta subset of cells, and reintroducing these cells into the patient to induce an in vivo therapeutic, tumouricidal reaction
                                                                                                                                                                                                                                                                                        Reagent for treating cancer without the need for e.g. radictherapy, comprises a specific V beta subset of T cells sensitized to a growing tumor and stimulated with superantigens.
                                                                                                                                                                                                                                                                                                                                                    Disclosure, Fig 2; 17pp; English.

SED was isolated and purified from S.aureus. It can be used for treating cancer, activating cytokine mediators and procoagulant systems, augmenting natural killer cell cytotoxicity, etc. The enterotoxic an be administered intravenously, optionally with ibuprofen to attenuate toxic reaction to SED. Synthetic polypeptides having structural homology to Staphylococcal exotoxins are claimed, provided the homology includes statisficially significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. See AAR13203-R13211

The invention relates to novel genes and encoded proteins from Staphylococcus aureus. A composition comprising the S. aureus protein, a nucleic acid encoding the protein, or an antibody to the protein, is useful as a pharmaceutical, particularly as a vaccine for treating or preventing infection due to Staphylococcus bacteria, specifically an infection caused by S. aureus. The composition is particularly useful for treating or preventing sepsis in a patient. The composition can also be used for diagnostics. The protein is also used in an assay for enzymatic studies and as a target for antibiotics. This sequence represents one of the novel S. aureus proteins of the invention
                                                                                                                                                                                                                                      protein, useful as a vaccine for treating or infection, specifically an infection caused by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is the protein sequence of staphylococcal enterotoxin D (SED). The invention provides novel conjugates (see ABP58454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABP58455), and an antibody moiety, such as tumour reactive antibody 574. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)

The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the encoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the infections. The transformed host cells are useful for analysing the superantigens to MHC class II or T-cell antigen receptors. The present sequence represents the amino acid sequence of the bacterial superantigen
                                                                                                                                                                                                                                                     New superantigen toxin and/or DNA fragment with an altered binding of the encoded altered toxin to either MHC class II or T cell antigen receptor, useful for treating or ameliorating superantigen-associated bacterial infection.
                                                                                                                                                                                                                                                                                                                                               Example 1; Page 36; 50pp; English

New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection.

Disclosure, Fig 3; 68pp; English.

The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHZ class II or T cell antigen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered TST-1 (toxic shock syndrome toxin) is uperantigen toxin peptide, diagnosing superantigen-associated bacterial infection, an autered TST-1 (toxic shock syndrome toxin) for producing antigent cand immunogenic response resulting in the protection of a mammal against superantigen-associated bacterial infection, an infection and an altered associated bacterial infection, and treating/ameliorating a superantigen-associated bacterial infection, and antigent isolated from individuals immunised with one or more altered TST-1 superantigen toxin and an antibody which recognises altered TST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, C1 (SEA, SEB). The superantigen toxin DNA fragment is useful for preparing a composition for treating a preventing bacterial infection. The present sequence represents the S. aureus enterotoxin B, SEE, MHC binding region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a novel polypeptide, which is optionally expressed in NCIMB 40771. The polypeptide, and polynucleotide encoding it, are derived from Staphylococcus aureus. Cells expressing ligands binding the polypeptide can be used to isolated candidate compounds that bind and inhibit the activity of the polypeptide. Such compounds that used as anti-bacterial compounds. The polypeptide may also be used as an immunogen to vaccinate an animal for protection against Staphylococcus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1 MYGGVTLHDINNRLTEEKKVPINLWLDGKXNTVPLETVKTNKKNVTVQELDLQARRYLQEK 60

                                                       The invention relates to an isolated and purified superantigen toxin and/or DNA fragment, which has been altered so that the binding of the incoded toxin to either major histocompatibility complex (MHC) class II or T cell antigen receptor is altered. The superantigen toxins, DNA fragments, and vaccines are useful for treating or ameliorating purperantigen associated bacterial infection. The DNA fragments are particularly useful for producing vaccine against superantigen toxin infections. The transformed host cells are useful for analysing the effectiveness of drugs and agents that affect the binding of superantigens to MHC class II or T-cell antigen receptors. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                102
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an isolated and purified superantigen toxin DNA fragment is altered so that binding of the encoded altered toxin to either the MHC class II or T cell anispen receptor is altered. Also included are a recombinant DNA construct (comprising a vector and an isolated and purified altered superantigen toxin DNA fragment), a host cell transformed with the recombinant DNA construct, producing altered superantigen toxin, an altered TSST-1 (toxic shock syndrome toxin)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New superantigen toxin DNA fragment, useful for preparing a composition for treating or preventing bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 SHDQFLQHTILFKGFFTDHSWYNDLLVDFDSKDIVDKYKGKKVDLYGAYGYCAGGTPN

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
superantigen toxin peptide, diagnosing superantigen-associated bacterial infection, a vaccine (comprising an altered superantigen toxin for of a mammal against engine resoluting in the protection of a mammal against superantigen-associated bacterial infection, an treating/ameliorating a superantigen-associated bacterial infection, an antisera isolated from individuals immunised with one or more altered TSST-1 superantigen toxin and an antibody which recognises altered TSST-1. Also disclosed are mutated staphylococcal enterotoxin A, B, C1 (SEA, SEB, SEC1) and streptococcal pyrogenic enterotoxin a and b (SFBa and SPBb). The superantigen toxin DNA fragment is useful for preparing a composition for treating or preventing bacterial infection. The present sequence represents the S. aureus enterotoxin A, SEA, MHC binding region
                                                                                                                                                                                                                                                                                                                                                                                     9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is the protein sequence of staphylococcal enterotoxin D (SBD). The invention provides novel conjugates (see ABPS4454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/F-120 (see ABPS4855), and an antibody moiety, such as tumour reactive antibody ST4. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for

The invention relates to pyrogenic toxins, such as staphylococcal enterotoxins, modified in the disulfide loop region.

The invention relates to pyrogenic toxins, such as staphylococcal enterotoxins, modified in the disulfide loop region. Typically, the modification involves deletions within the disulfide loop region of SEC (see AAY06261). The modified toxins retain useful biological properties, such as the ability to induce cytokine production,
                                                                                                                                                                                                      the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         --KKVPINLWIDGKQTTVPIDKVKTSKKEVTVQELDLQARHYLHGKFGLYNSDSFGGKVQ 180
Typically, the modification involves deletions within the disulfide loop region of SEC (see AAY06261). The modified toxins retain useful biological properties, such as the ability to induce cytokine production, but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Emetic response inducing activity are typically decreased by at least about 100-fold, while LDSO (in Dutch Belted rabbits) is at least 100-fold higher than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         99

New modified staphylococcal enterotoxin derived from a native disulfide loop-containing pyrogenic toxin, useful for non-specifically enhancing simmune function and as a vaccine against toxic shock syndrome or food
but have substantially reduced toxicity compared to the corresponding unmodified native toxin. Emetic response inducing activity and fever inducing activity are typically decreased by at least about 100-fold while LD50 (in Dutch Belted rabbits) is at least 100-fold higher than
                                                                                                                                                                                                                                                                                                                                                   11 DLRKKSELQGTALGNLKQIYYYNSKAITSSE-KSADQFLTNTLLFKGFFTGHPWYNDLLV

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               182
comprises a disulphide loop having no more than 10 amino acids. The modified toxin has a fever-inducing activity or an emetic responsetinducing activity decreased by about 100-fold in comparison to a native toxin. The modified pyrogenic toxin, that is a staphylococcal enterotoxin, is useful for non-specifically enhancing an immune function and for vaccination against diseases such as toxic shock syndrome and food poisoning. This sequence represents the staphylococcal enterotoxin, second FR1913
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   122
